**PROVED SIRES IN ARTIFICIAL BREEDING SERVICE JANUARY 1, 1955**

On January 1, 1955 there were 2,450 sires in artificial-breeding service in the United States. Of this number, 883, or 36.0 percent, were proved sires. A summary of the 883 proved-sire records is given in the following tables.

Table 1. --Summary of AB proved-sire records by breed

Breed	Number sires	Dams			Daughters		
		Milk	Test	Fat	Milk	Test	Fat
		pounds	percent	pounds	pounds	percent	pounds
Ayrshire	43	9,480	4.1	386	10,533	4.2	444
Brown Swiss	82	10,879	4.0	439	11,625	4.2	486
Guernsey	189	8,540	4.9	415	9,013	4.9	444

# DHIA PROVED-SIRE RECORDS TABULATED IN JUNE 1955

Following is a list of 609 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in June 1955. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i.e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i.e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
